Listening to Young Lives at Work:

COVID-19 Phone Survey Second Call

December 2020

Young Lives

Constructing the “typesite variable” using Young Lives data

The variable typesite collects information on the location where the respondent was surveyed and not necessarily their permanent place of residence. It is constructed as a dummy variable indicating if the respondent lives in an urban or rural area.

This variable is constructed using the addresses given by the respondents for tracking purposes (this information is then anonymized and not made publicly available). The addresses are checked and assigned into urban or rural areas of the provinces in which the respondents were surveyed.

Food Insecurity Experience Scale (FIES) survey data

The validation of the FIES data is ongoing in collaboration with the Food and Agriculture Organization (FOA). As such, these data are not included in the current data release, but they will be archived at a later date once validation is complete
